

IBM

Turning fragmented revenue data into actionable insights for product managers.

During my Product Management internship at IBM, my fellow interns and I developed Telos, a 0-to-1 internal revenue analytics platform built in 45 days to support 12 product managers across IBM's \$1B+ Z portfolio.

Product and revenue data previously lived across disconnected sources and manual Excel workflows, making it difficult for PMs to understand why deals were lost, compare account performance, and identify growth opportunities.

We brought CRM, revenue, deployment, and usage data together through PostgreSQL and MCP, enabling PMs to explore information through natural-language queries.

I worked across product strategy, UX, data, and AI, defining requirements with PMs, designing dashboard experiences and workflows, and integrating AI-powered analysis with IBM Bob. Our analysis uncovered missing loss reasons in 70% of lost deals and helped surface \$75M in potential annual expansion opportunities through account benchmarking.

LINK PROJECT

Altheros Capital

Leading design across 10 client products and a 20-person design team.

As UI/UX Design Administrative Lead, I managed 20 designers across 10 projects, matching designers to projects based on their interests and strengths while supporting teams throughout the design process.

I worked closely with product managers, business leads, and developers to translate product needs into design direction, troubleshoot UX challenges, and coordinate design resources across teams.

Several projects progressed from early product requirements through design, development, and final client delivery.

My Role

UI/UX Design Administrative Lead

Medium Design Collective

Designing and leading client projects from brand identity to digital experiences.

Through Medium Design Collective, I worked across client projects as both a product designer and project manager, translating client needs into visual identities and digital experiences while collaborating with multidisciplinary design teams.

CGCC

Building a cohesive visual identity through collaborative brand exploration.

As part of a four-person design team, I collaborated on visual concepts, logos, presentation assets, and brand guidelines, translating client goals into a consistent visual identity.

New York State Bridge Authority

Improving internal operations and employee experiences within government.

During my internship with the New York State Bridge Authority, I worked across project management, operations, HR, and IT to improve internal processes and employee experiences.

I partnered with the CIO and IT team to redesign the new-hire onboarding video system, supported the onboarding of 10+ employees, and organized 200+ onboarding packets to streamline administrative workflows.

I also designed internal communications and HR materials in Canva, bringing greater consistency and clarity to employee-facing resources.

INFO 1998 Intro to Digital Product Design

A Spotify feature concept that makes adding and managing multiple songs more efficient while staying familiar to existing users.

My Role

Product Designer · Individual Case Study

Timeline

Feb. – May 2024

The Challenge

Adding one song at a time shouldn't be this tedious.

Spotify makes discovering music easy, but building and managing playlists can become repetitive when users want to work with several songs at once.

Through my initial research, I identified two recurring pain points:

01 · Adding multiple songs takes too many repeated actions

Users have to repeat the same process for each song they want to move or add to another playlist.

02 · Large playlists become difficult to manage

As playlists grow, selecting and organizing individual songs becomes increasingly cumbersome.

This led me to ask:

How might I make adding and managing multiple songs in a Spotify playlist faster without disrupting an experience users already understand?

User Research

Understanding how people actually build playlists.

Rather than immediately jumping into a solution, I wanted to understand how people currently discover music, build playlists, and organize their songs on Spotify.

Discovering Music · Organizing Playlists · Music Features

Across different listening habits, one frustration repeatedly emerged:

Users wanted a faster way to select and manage several songs at once.

The problem wasn't necessarily finding music. The friction appeared once users already knew which songs they wanted and needed to organize them.

The Opportunity

Rather than redesigning playlist management entirely, I focused on one high-frequency interaction:

Multi-selecting songs before adding or removing them from playlists.

This gave me a focused opportunity to reduce repetitive actions without asking users to completely relearn Spotify.

Learning From Spotify's Existing Patterns

Building on what users already know.

Before developing the interaction further, I looked at how Spotify already handles playlist management.

Spotify's existing playlist menu includes an **"Add to other playlist"** action, and its destination selector already provides search, sorting, and playlist browsing.

Instead of replacing these familiar interactions, I focused on improving what happens **before** them: allowing users to select multiple songs first and then perform an action on the entire selection.

Design Opportunity

Keep Spotify's familiar destination-selection experience while introducing a faster way to select multiple songs.

Exploring the Interaction

How could multi-select fit into Spotify's existing experience?

My early sketches explored how users could enter selection mode, select multiple songs, and add or remove them without leaving their playlist.

Instead of focusing on visual polish, I used these sketches to think through the interaction itself.

I explored questions like:

How should users enter multi-select mode?

How should selected songs be distinguished?

Where should Add, Remove, and Cancel actions live?

How should Spotify communicate that an action is complete?

Feature 1: Multi-Select

Adding to
New playlists

Being added
to the beginning
of playlist. (depends
on the way it's
being sorted)

A pop up done
check marker

When hitting Done, nothing happens.

Early Direction

The sketches helped establish the core interaction: users would intentionally enter a **selection mode**, choose multiple songs directly within their playlist, and then perform an action on the entire selection.

Keeping selection inside the existing playlist also meant users wouldn't have to leave their current context just to manage multiple songs.

From Low-Fi to Mid-Fi

Turning the idea into a complete interaction.

Once the core interaction was established, I translated the sketches into a more structured mid-fidelity flow.

The experience became:

Playlist → Select Mode → Select Songs → Add to Playlist → Choose Destination

01 · A Clear Entry Point

A dedicated **Select** action gives users an intentional way to enter multi-select mode without changing how the normal playlist behaves.

02 · Visible Selection States

Selection controls appear beside each song once the mode is activated, helping users distinguish between selected and unselected tracks.

03 · One Action, Multiple Songs

Instead of completing the same action for every song, users can build their selection first and then add or remove multiple songs at once.

04 · Persistent Action Controls

Remove, Add, and Cancel remain accessible throughout selection mode, allowing users to take action without leaving the playlist.

From Mid-Fi to High-Fi

Making the interaction feel native to Spotify.

Moving into high fidelity wasn't simply about adding color. I refined the hierarchy, interaction states, and visual feedback so the feature would feel like a natural extension of Spotify rather than a separate experience.

01 · Stronger Selection Feedback

I introduced clearer selection indicators and Spotify green to distinguish active states, making it easier to understand which songs are currently selected.

02 · Clearer Action Hierarchy

Add, Remove, and Cancel remain persistent at the bottom of the screen, keeping the user's available actions visible throughout selection.

03 · Spotify-Native Visual Language

I incorporated Spotify's dark interface, green accents, playlist hierarchy, typography, and familiar UI patterns so users could focus on learning the new functionality rather than learning a new interface.

Key Design Decisions

01 · Select Without Losing Context

Instead of sending users to a separate selection screen, multi-select happens directly inside the playlist.

Users can continue browsing their songs, modify their selections, and see the playlist around them throughout the entire interaction.

Why?

Moving users into an entirely separate screen would introduce unnecessary navigation. Keeping selection in context makes the new feature feel like a **mode of the existing playlist rather than a separate tool**.

02 · Multiple Songs, One Action

The central goal of the redesign was reducing repeated actions.

Previously, managing several songs could require users to perform the same process over and over:

Select Song → Add → Choose Playlist → Return → Repeat

The redesigned interaction changes that to:

Enter Select Mode → Select Multiple Songs → Add Once → Choose Destination

This lets users finish the same task through one continuous flow.

03 · Familiar Patterns for New Functionality

I didn't want multi-select to require users to learn an entirely new playlist system.

Instead, I introduced the new interaction where it was needed while preserving familiar Spotify patterns for playlist browsing and destination selection.

This balance between **new functionality and existing behavior** helped the feature feel more integrated into the product.

Final Design

Select more. Repeat less.

The final experience allows users to enter selection mode, choose multiple songs, and manage their selection through one continuous flow.

Enter Select Mode

Users begin from the playlist they already know and activate multi-select through a dedicated **Select** action.

Build a Selection

Selection controls appear within the existing song list, allowing users to choose multiple tracks while remaining inside their playlist.

Add or Remove at Once

Persistent actions let users apply Add or Remove to their selection instead of repeating the action song by song.

Choose a Destination

When adding songs, users continue into Spotify's familiar playlist-selection experience to choose where the selected tracks should go.

Evaluating the Experience

Did the interaction solve the original problem?

The final prototype gave me a way to evaluate whether the new interaction was understandable and whether multi-select could fit naturally within Spotify's existing playlist experience.

The resulting flow addressed the core problem identified during research by allowing users to **build a selection first and act on multiple songs at once**, reducing the need for repeated playlist-management actions.

The process also reinforced an important design principle for me:

New functionality should be distinct enough to discover, but familiar enough to feel like part of the product users already know.

Reflection

My first step into product design.

This was my first end-to-end UX project and my first time designing extensively in Figma.

I initially approached the project by asking:

What could I add to Spotify?

Through research, synthesis, iteration, and prototyping, my thinking shifted toward a much more important question:

What problem actually needs to be solved, and what is the smallest change that could meaningfully improve the experience?

That shift became one of my biggest takeaways from the project.

I also learned that high-fidelity design isn't simply about making screens look polished. Decisions around hierarchy, interaction states, feedback, and iconography all influence whether users understand what they can do.

If I continued this project, I would conduct a larger round of usability testing, compare task completion time against Spotify's existing flow, and explore accessibility and edge cases for multi-select interactions.

Chinese Drama Society at Cornell

Building the visual identity behind Cornell's Chinese-language theatre productions.

As Publicity Lead, I lead a team of five designers creating the visual world around each production, from posters and playbills to merchandise and digital campaigns.

Beyond production publicity, another designer and I designed the society's website in Figma and built it in VS Code, creating a digital home that brings together our past productions and creative work.
